

What Is Claimed Is:

1 1. An iris, comprising:
2 a stator assembly comprising a frame
3 coupled to an electrically wound substantially
4 annular magnetic core;
5 a rotor rotatably coupled to said
6 substantially annular magnetic core and defining a
7 channel; and

8 a diaphragm coupled to said stator assembly
9 comprising a plurality of diaphragm leaves pivotally
10 arranged to form an adjustable aperture substantially
11 concentric with said channel; a first portion of at
12 least one of said plurality of diaphragm leaves
13 coupled to said stator, a second portion of another
14 of said plurality of diaphragm leaves coupled to said
15 rotor.

1 2. The iris of claim 1 further comprising
2 a body coupled to said stator assembly.

1 3. The iris of claim 2 further comprising
2 a sensor coupled to said body for detecting aperture
3 diameter data.

1 4. The iris of claim 3 further comprising
2 an actuator coupled to said body, said actuator
3 adapted to provide electrical current through
4 windings on said electrically wound magnetic core

10022881-121301

5 such that said rotor rotates in response to said
6 electrical current.

1 5. The iris of claim 4 further comprising
2 a controller coupled to said body adapted to receive
3 data from said sensor, said controller containing
4 logic designed to activate said actuator in response
5 to said data.

1 6. The iris of claim 2 wherein said body
2 comprises a telescope.

1 7. The iris of claim 2 wherein said body
2 comprises a camera.

1 8. The iris of claim 2 wherein said body
2 comprises a pipe.

1 9. An iris system comprising:
2 a first annular member comprising a first
3 frame coupled to a first magnetic core, said first
4 frame comprising a sidewall, a first annular element
5 circumjacent at one end of said sidewall, a second
6 annular element circumjacent at another end of said
7 sidewall, said first annular element having a first
8 opening, said second annular element having a second
9 opening such that a first channel is defined through
10 said first frame;

10022001-121301

11 a second annular member comprising a second
12 frame coupled to a second magnetic core juxtaposing
13 said first magnetic core, said second annular member
14 rotatably coupled to said first annular member such
15 that a second channel is defined substantially
16 concentric with said first channel; and

17 a plurality of leaves adapted to rotate to
18 form an adjustable aperture substantially concentric
19 with said first channel, a first portion of a first
20 leaf of said plurality of leaves rotatably coupled to
21 said first annular element of said first annular
22 member, a second portion of a second leaf of said
23 plurality of leaves rotatably coupled to said second
24 annular member.

1 10. The iris of claim 9 further comprising
2 a body coupled to said first annular member.

1 11. The iris of claim 10 further
2 comprising a sensor coupled to said body for
3 detecting aperture diameter data.

1 12. The iris of claim 11 further
2 comprising an actuator coupled to said body, said
3 actuator adapted to send electrical current through
4 windings on said first magnetic core such that said
5 second annular member rotates in response to said
6 electrical current.

10022861-121301

1 13. The iris of claim 12 further
2 comprising a controller coupled to said body adapted
3 to receive data from said sensor, said controller
4 containing logic designed to activate said actuator
5 in response to said data.

1 14. The iris of claim 10 wherein said body
2 comprises a telescope.

1 15. The iris of claim 10 wherein said body
2 comprises a camera.

1 16. The iris of claim 10 wherein said body
2 comprises a pipe.

1 17. The system of claim 9 wherein said
2 first magnetic core is coupled to said sidewall.

1 18. The system of claim 9 wherein said
2 first magnetic core is coupled to said second annular
3 element.

1 19. An iris system, comprising:
2 a body;
3 a stator assembly, coupled to said body,
4 comprising a frame coupled to an electrically wound
5 substantially annular magnetic core;

10022881-21301

6 a rotor rotatably coupled to said
7 substantially annular magnetic core, such that a
8 channel is defined;

9 a diaphragm coupled to said stator assembly
10 comprising a plurality of diaphragm leaves pivotally
11 arranged to form an adjustable aperture substantially
12 concentric with said channel; a first portion of at
13 least one of said plurality of diaphragm leaves
14 coupled to said stator, a second portion of another
15 of said plurality of diaphragm leaves coupled to said
16 rotor;

17 a sensor coupled to said body for detecting
18 aperture diameter data;

19 an actuator coupled to said body, said
20 actuator adapted to provide electrical current
21 through windings on said electrically wound magnetic
22 core such that said rotor rotates in response to said
23 electrical current; and

24 a controller coupled to said body and
25 adapted to receive data from said sensor, said
26 controller containing logic adapted to activate said
27 actuator in response to said data.

1 20. The iris of claim 19 wherein said body
2 comprises a telescope.

1

2 21. The iris of claim 19 wherein said body
3 comprises a camera.

1002661.121301

4 22. The iris of claim 19 wherein said body
5 comprises a pipe.

10022681, 121301
